Most laboratory mice have a prolonged life span and a large range of free variation in a large number of physiological and behavioural variables; this behavioural plasticity allows them to thrive in a wide variety of environmental conditions. However, when subject to extreme environmental conditions, mice may develop spontaneous disease. The genetic basis of such disease remains largely to be discovered, and the identification and subsequent characterisation of mouse disease genes is a very active area of research. We provide a brief overview of spontaneous disease in laboratory mice and describe some of the techniques available to identify the genes involved.Q.
